Brief Explanation :

Endpoint Syntax:

```
GET /check/:number
```

Explanation:

1. **GET**
   - This is the HTTP method.
   - It is used to **retrieve data** from the server. In this case, we are checking a number.
2. **/check/**
   - This is the **route path**.
   - It tells the server which functionality to run. Here, it points to the "check number" functionality.
3. **:number**
   - The **colon** : means it's a **route parameter**.
   - The value in the URL will be dynamic. For example:
     - `/check/4` ⟶ `number = 4`
     - `/check/7` ⟶ `number = 7`
   - You can access this value in Express using:
   - `const num = req.params.number;`
4. **Return Value (JSON)**
   - If the number is **even**, return:
   - `{ "message": "OK" }`
   - If the number is **odd**, return:
   - `{ "message": "Not allowed" }`
